## Focus for Impact – understanding the background

At the heart of the NSP 2017-2022, is the strategy to “focus for impact” using the more detailed information and insights which have become available. While comprehensive prevention and care will be provided countrywide, intensified, concentrated efforts will be made in HIV and TB high burden areas. In these high-burden areas, redoubled efforts will draw on detailed, innovative data sources (such as geospatial mapping) to identify those most at risk. This will lead to saturation of high-impact prevention and treatment services and strengthened efforts to address the social and structural factors that increase vulnerability to infection. Nationally, but especially within these high-burden areas, key and vulnerable populations most heavily affected by the epidemics will receive intensified focus to empower them, improve service access and reduce barriers to service uptake. The “focus for impact” approach represents a new, transformative way to achieve reductions in the morbidity and mortality associated with HIV and TB and morbidity from STIs. In line with the evidence, there will be a substantially stronger focus on adolescent girls and young women as well as key and vulnerable populations, not forgetting adolescent boys and young men.

The process for identifying high-burden areas for intensification of efforts dates back to September 2015, when the SANAC Secretariat established the Hotspot Mapping Advisory Committee. The Committee – including governmental and non-governmental epidemiological experts as well as international partners – was tasked with developing a transparent, multi-sectoral, locally informed and user-friendly approach to Focus for Impact.

An approach was developed that use geospatial mapping and risk profiling to allow stakeholders to have a more granular understanding of geospatial variations in HIV, TB and STI burden. The **model aims to answer four key questions:**

- (a) **Where** in a particular district **are the areas with the highest HIV and/or TB burden?**
- (b) **Why** does a **specific area** have a higher HIV and/or TB burden (i.e. what are the contributing/associated factors)?
- (c) **Who** is the most vulnerable population?
- (d) **Which multi-sectoral interventions** may be deployed in the high-burden area to reduce associated HIV and/or

To maximise the impact of efforts, the NSP introduces this more intensified, more strategic focus at provincial, district and ward levels. There will be a greater priority on primary prevention and on strategies to address the social and structural drivers of the three infections in a thoroughly multi-sectoral manner. South Africa’s recent success in scaling up prevention and treatment programmes will be complemented by an equivalent focus on improving service quality and on reducing loss to follow-up among people who initiate care, while simultaneously implementing the new “test and treat” policy. Recognising that different people require different prevention approaches, differentiated care models will be scaled up to tailor interventions to each person’s needs, including increased link with community-centred service delivery. Priority is given to ensuring that treatment programmes are holistic and address each person’s health needs, including co-morbidities. The success of this approach will stem from the collection and timely use of high-quality data to guide and inform programmes and policies.

The ultimate success of the NSP 2017 – 2022, relies on effective implementation at the provincial, district and ward levels. From the national to the local context, three levels of focus will accelerate implementation of the Plan and optimise its impact:

- **Spatial location:** The NSP calls for steps to ensure the delivery of comprehensive services to all who need them, regardless of where they live. In cognisance of the marked geographic variation in disease burden, intensified action is required in localised areas of high burden for intensified action. In each of these high-burden areas:
  - 1) ambitious coverage targets will be set;
  - 2) current and new programmes will focus strategically on those in greatest need; and
  - 3) other strategies will be intensified to address the social and structural factors that increase individual and community vulnerabilities which contribute to the disease burdens.

This component links with the first question that the Focus for Impact model aims to answer: *“Where in a particular district are the areas with the highest HIV and/or TB burden?”*

- **Population and community profile:** The community profile is completed once a high burden area is identified using secondary data from multiple sources (health, education, socio-economic) and the provision and utilisation of services is described. The engagement with the community is to identify priorities of the risks for HIV, TB and STIs in that specific area and gaps in service delivery to address these priorities.

In each of these high-burden areas, programmatic efforts will be strategically targeted towards the populations among whom the need is greatest, and where the impact of efforts will be most pronounced. Given the degree to which transmission among adolescent girls and young women is driving HIV across the country, *every* province, district and ward must take steps to intensify efforts to reduce new HIV infections and increase service access for adolescent girls and young women, including addressing the social and structural factors that increase their vulnerability. Guided by local data and circumstances from geospatial mapping and profiling, provincial and local responses should prioritise key and vulnerable populations.

This component links with the second question that the Focus for Impact model aims to answer: *“Why does a specific area have a higher HIV and/or TB burden (i.e. what are the contributing/associated factors)?”*

- **Multi-sectoral interventions:** Enhanced focus is also needed on the combination of interventions that are prioritised for scale-up. Priority will be placed on implementing the right mix of high-value, high-impact interventions that will maximise the number of new infections and deaths averted.

**Multi-sectoral** refers to deliberate collaboration among various stakeholder groups (e.g., government, civil society, and private sector) and sectors (e.g., health, environment, economy) to jointly achieve a common goal. In this case reducing the associated risks in high burden areas

This component links with the third question that the Focus for Impact model aims to answer: *“Which multi-sectoral interventions may be deployed in the high-burden area to reduce associated HIV and/or TB risks?”*

## **Acknowledgement**

The initial work for the development of the Focus for Impact approach was funded through SANAC by the Centers for Disease Control and Prevention under Grant No CDC-RFA-GH13-1338 and in-kind contributions from the National Department of Health. Subsequent work is funded under the Global Fund.

Any opinions, findings, and conclusions or recommendations expressed in this material are those of the author(s) and do not necessarily reflect the views of the Funders.

## Introduction to Profile

This profile presents secondary (public and non-public) data on the HIV and TB epidemics and population demographic profile, enriched with information collected from the community identified associated risk factors, services and assets in Jozini Local Municipality in the uMkhanyakude district, KwaZulu Natal. The latest available ward level population data is that from Census 2011. This is used as the basis for the population data and aligned with boundaries within this report.

The profile is intended to give the AIDS Councils and any other planning groups a thorough understanding of the HIV, TB and STI related context within this district. By reflecting who is at risk of becoming HIV infected and where they are within a specific location, the profile assists to identify the people who need prevention and care services

The profile highlights factors that influence the risks of HIV and TB infection. Such factors include the socio-economic status e.g. structural measures of poverty; sexual risk behaviours such as condom use, multiple sexual partnerships and transactional sex in a given population in a specific service area and/or administrative area. The same applies to data on exposure to psycho-active substances, report or history of sexually transmitted infections (STIs). Data is presented at the level that it is available. The risk factors are explored within the categories of the socio-demographic data (e.g., age, sex, race, educational status) at wards level.

The profile for this specific area includes two types of data: 1) secondary (public and non-public) data and 2) local knowledge and understanding of what influences the associated risk profile. Information that reflects the local knowledge and understanding of the associated risk profile for the area is collected through community engagement through stakeholder and community workshops in the specific catchment area. More detail on the approach is described in Appendix C: Methodology for stakeholder engagement to explore local level data.

For this profile, the catchment area for Mkuze Clinic, Jozini Local Municipality is defined as Jozini Ward 20. For this specific profile, two stakeholder and community workshops held on 3 and 4 August 2017 in Mkuze Hall and uMkhanyakude District Municipality Council Chamber, Mkuze. The workshops were attended by 66 stakeholders and community members during these two days. As more local level profiles are completed within the Local Municipality, a richer picture of the context within Jozini Local Municipality will evolve. The same applies to more granular data that becomes available for this specific catchment area. This profile will be updated accordingly and should therefore be considered a living document.

During the workshops participants identified the following priorities for consideration during the implementation of multi-sectoral interventions and focus of key and vulnerable populations to reduce the HIV associated risk in the Mkuze clinic catchment area:

- Key and vulnerable populations:
  - Sex workers
  - Drug users
  - Young women and girls
- Interventions that address:
  - Poverty, especially livelihoods support, to mitigate transactional sex as a source of income
  - Comprehensive, targeted, location-specific HIV prevention programmes designed for sex workers and truck drivers
  - Substance abuse, particularly among youth and by-law enforcement at liquor outlets (licensing conditions)
  - Employment programmes targeted at vulnerable populations
  - Overcrowding in RDP settlements that contribute to sexual risk behaviour

## 1. Socio-demographic profile

### 1.1 Demarcated boundaries

uMkhanyakude District is one of the 11 district municipalities of KwaZulu-Natal province. The Jozini Local Municipality is one of the five Local Municipalities in uMkhanyakude district. The rest are Mhlabyalingana, Hlabisa, Mtubatuba and The Big 5 False Bay Local Municipalities.

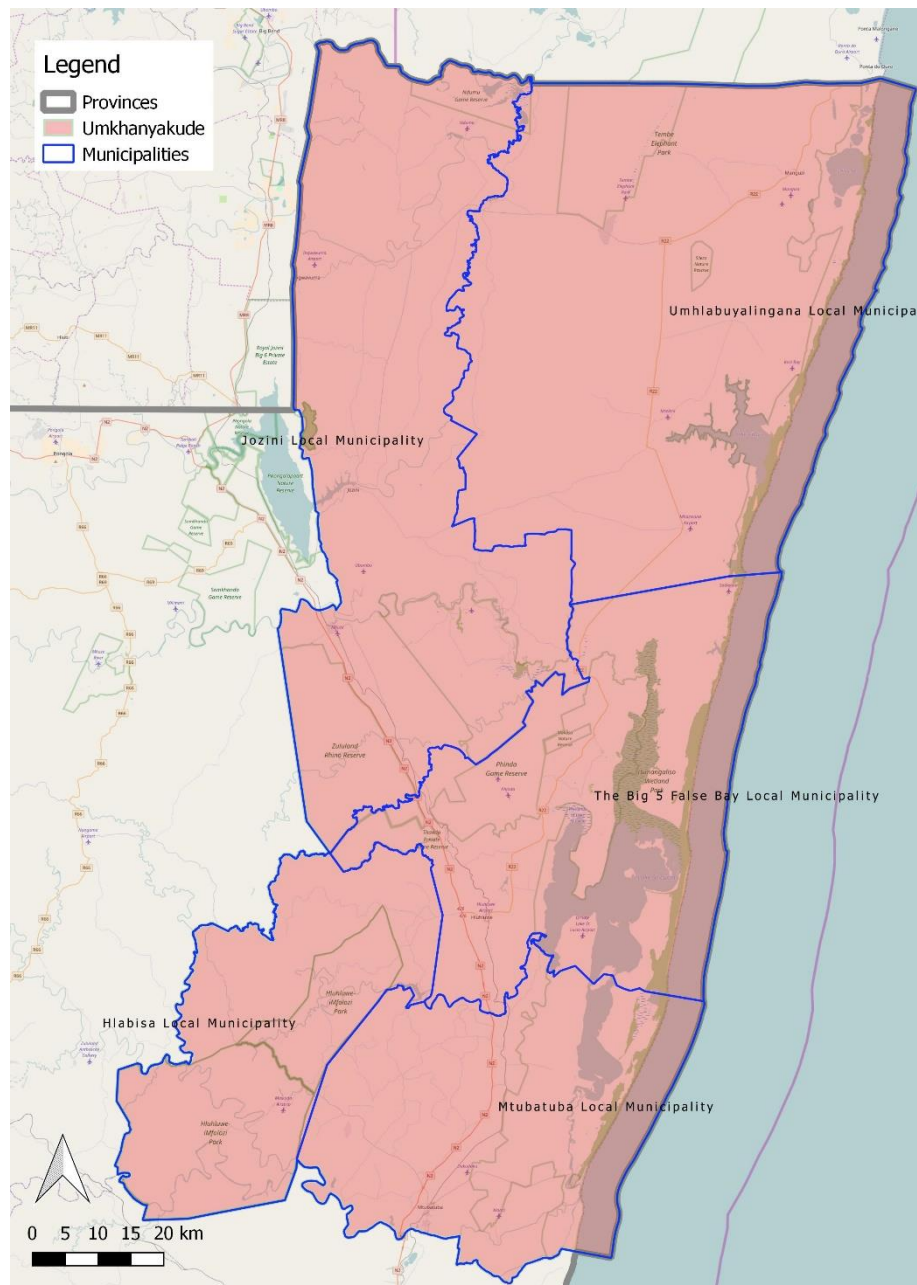

Figure 1: Local Municipalities' uMkhanyakude district

The Jozini Local Municipality constitute of 20 administrative wards (see Figure 2).

**Figure 2: Distribution of Wards in the Jozini Local Municipality**

## 1.2 Population by sex and age

During the 2011 Census 186 468 people were counted in the 20 wards. Table 1 summarises the age and sex per population in these wards. Females constitute 54% of population, compared to males at 46%. Young people ≤ 25 years (65%) make up the majority of population in the Local Municipality. The detail for Ward 20 that forms the catchment area for Mkuze Clinic is highlighted in the table below.

**Table 1: Population per age groups per ward, Jozini Local Municipality**

| Ward     | Age   |       |       |       |       |       |        | Sex    |       |        |
|----------|-------|-------|-------|-------|-------|-------|--------|--------|-------|--------|

Figure 3 below reflects the population pyramid for Jozini Local Municipality. This figure visualises sex (male and female) and age in five-year age bands for this population. It is noted that the biggest group is in the age group 0-4, followed by the age group 10-14 and 15-19 years old.

Figure 3: Population Pyramid Jozini Local Municipality

From this population, 41.3% children and 3.9% elderly are dependent on the 54.8% economically productive ages in the population of the Jozini Local Municipality (Figure 4).

Figure 4: Dependency ratio Jozini Local Municipality (Source Census 2011)

In the catchment area for the Mkuze Clinic (Jozini Ward 20) there is a change in the population profile (Figure 5) with a youth bulge and different male to female distribution to that seen in the Jozini Local Municipality population pyramid in Figure 3.

Figure 5: Population Pyramid Mkuze clinic catchment area (Source Census 2011)

In the same catchment population, 28.4% children and 2.2% elderly are dependent on the 69.3% economically productive age group (Figure 6).

Figure 6: Dependency ratio Mkuze clinic catchment area (Source Census 2011)

### 1.3 Population by race

The dominant population group in Jozini Local Municipality is Black African at 99.2% followed by white at 0.3% (detail in Figure 7 and Table 3).

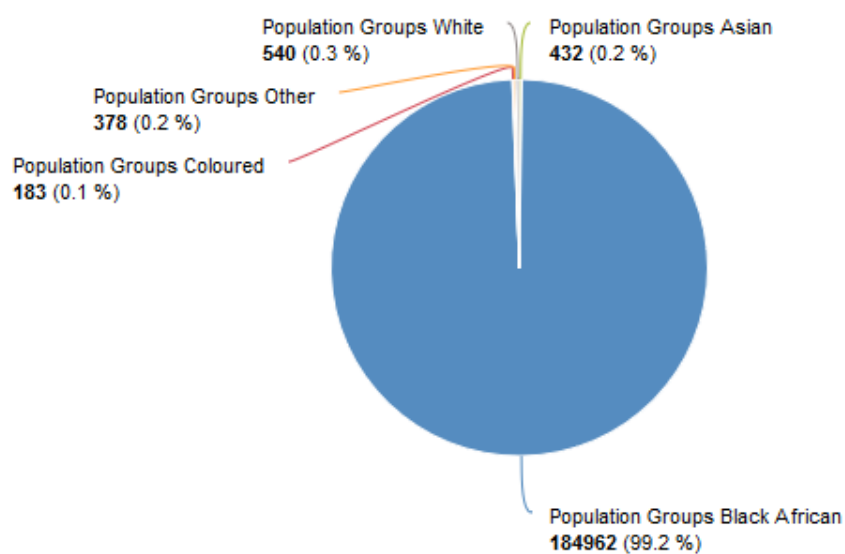

Figure 7: Population group distribution in Jozini Local Municipality (Source Census 2011)

The detail for Ward 20 that forms the catchment area for Mkuze Clinic, are highlighted in the table below.

**Table 3: Ward level population distribution by Race in Jozini Local Municipality**

## 2. Epidemiological profile

### 2.1 Causes of death

With the roll out of ART in South Africa, AIDS is now considered a chronic disease since many people living with HIV are living longer. The main causes of death, the uMkhanyakude district is TB (xxx%) followed by HIV (xxx%) (Table 4). The profile would also show five-year series to show the trend of deaths over the past 5 years comparing AIDS related deaths and all-cause mortality at a local level.

Table 4: Main cause of deaths in the uMkhanyakude District (Source STATSSA)

| Cause                         | Number of deaths | Percent deaths |
|-------------------------------|------------------|----------------|
| Tuberculosis                  |                  |                |
| HIV Disease                   |                  |                |
| Diabetes Mellitus             |                  |                |
| Cerebrovascular Disease       |                  |                |

### 2.2 HIV

The figures that follow below reflects the HIV positivity rate based on the routine health data collected, collated and reported in health facilities in the uMkhanyakude district. The definitions for these indicators can be found in Appendix B.

Due to the small numbers at a local level, it is not included at ward level in this report. See note on small number in Appendix A: Selecting Data for the Profile.

## 2.4 STIs

Sexually transmitted infections (STIs) are a major risk factor to the human immunodeficiency virus (HIV) epidemic<sup>1</sup>. The presence of a sexually transmitted infection, such as syphilis, gonorrhoea, or herpes simplex virus infection, greatly increases the risk of acquiring or transmitting HIV infection (by two to three times, in some populations). The HIV-1 infected persons with STIs are at increased risk of transmitting HIV-1 because genital tract shedding of HIV-1 is elevated in the presence of genital tract inflammation<sup>23</sup>. v. In 2014, HIV co-infection amongst STI patients remained relatively high with a HIV co-infection of 30.1%<sup>45</sup> among those with male urethritis syndrome, 40.3% among those with vaginal discharge syndrome and 46.3% among those with genital ulcer syndrome<sup>6</sup> Location is also a factor. Ramjee et.al confirms the high prevalence and incidence of STIs among women living in rural and urban communities of KwaZulu-Natal. Therefore, STI control programmes need to be embedded in HIV care and treatment programmes and vice-versa in order to achieve optimal benefit in ameliorating the impact of HIV, AIDS and STIs.

The figure below reflects the STI burden based on the routine health data collected, collated and reported in health facilities in the uMkhanyakude district. At this point the most robust data is for Male urethritis syndrome rate. As the data quality for other STI routine health indicators improve, it will be included in updated profiles. The definitions for this indicator can be found in Appendix B. Due to the small numbers at a local level, it is not included at ward level in this report. See note on small number in Appendix A: Selecting Data for the Profile.

### 3. Associated risk profile

#### 3.1 Biomedical Profile

##### 3.1.1 HIV Testing

Awareness of one's HIV status through HIV Testing Services (HTS) is pivotal to accessing prevention, care services, and ARV treatment which mitigate the impact of HIV <sup>7</sup>. It is therefore important to determine the success of routine HIV testing and counselling by the department of health. From the National 2013 HIV testing campaign, nearly two-thirds of respondents (65.5%) indicated that they had tested for HIV with females reporting higher rates of testing (71.5%) than of males (59%)<sup>8</sup>. 78% of adults aged 25–49 years reported testing compared to youth aged 15–24 years (50.6%) and the elderly (aged 50 years and older) (54.8%)<sup>9</sup>.

Stakeholder and community engagement workshops revealed the following about *HIV Testing Services* in the area:

- Testing is available at clinics for free;
- The people who test are mainly women. Pregnant women must test for HIV on their first visit in order to not infect their baby with HIV; and
- Most men do not want to test. They prefer to be in denial about HIV, or they are afraid to know their status.

##### 3.1.2 Circumcision

Voluntary medical male circumcision (VMMC) is being scaled up in the country because it has been shown to be partially effective in reducing HIV infection among males<sup>10</sup>. Nationally, there are reported about 46.4% circumcisions, with a significant lower percentage of men aged 15–19 years compared to all age groups. High percentage of black Africans (52.4%) reported that they were circumcised compared to the other three race groups<sup>11</sup>.

Stakeholder and community engagement workshops revealed the following about *circumcision* in the area:

- Medical male circumcision is done in this area; and
- Although men are educated about the necessity of condom use after circumcision, they tend to behave differently, as they misinterpret reduction in the risk of infection, as being equivalent to immunity.

<sup>11</sup> Shisana, O., T. Rehle, et al. (2014). South African National HIV Prevalence, Incidence and Behaviour Survey, 2012. Cape Town, HSRC Press.

### 3.1.3 ARV treatment

Stakeholder and community engagement workshops revealed the following about **ARV treatment** in the area:

- ARV Treatment is available for free at all nearby clinics;
- There are also places such as the community hall where people can collect their medication from the Community Care Givers (CCG);
- People do have sufficient knowledge as there are CCGs who work in the area who go door-to-door, educating the community about different illnesses. They tend to be avoidant of the correct behaviour;
- There are no barriers to access in terms of collecting treatment as there are various collection methods available;
- Alcohol is a major hindrance when it comes to people adhering to their treatment;
- There is loss to follow up to some extent when people use aliases rather than the names in their ID books; and
- The single pill treatment is good, but it is seen as causing people to become hypersexual.

### 3.1.4 PEP and PrEP

PrEP and PEP is not known to the community.

### 3.1.5 Lubricant

During the stakeholder and community engagement workshops it was noted that in general the community do not have access and do not know about lubricants.

## 3.2 Behaviour that can influence risk for HIV infection

The reported high incidence among young women aged 15–24 years (2.54; 2.04–3.04) approximately 116 000 new infections compared to young men (0.55; 0.45–0.65) approximately 26 000 new infections<sup>12</sup> calls for need to address the associated social factors such as age-disparate relationships, particularly at local level. However, data on factors influencing risk of HIV infection e.g. condom use, multiple sexual partnerships, intergenerational sex, transactional sex, risky sexual practices (anal sex) are not routinely collected. Such data are mostly obtained from independent behavioural surveys<sup>13</sup>, and are reported at provincial level which is much higher than district, Local Municipalities, and high burden areas. There is need for the department of health to devise approaches to routinely collect quantitative data on sexual risk behaviours in identified local levels and/or high burden areas.

---

<sup>13</sup> *ibid*

### 3.2.1 HIV Knowledge

The following was discussed around **HIV knowledge** during the stakeholder and community engagement workshops in the area:

- Some people are knowledgeable about HIV, while others are not;
- There is still not enough education about HIV, how to prevent it or where to access treatment;
- However, CCGs do run awareness campaigns, and distribute condoms;
- Some men believe that if they are circumcised, they cannot be infected;
- Some men believe that sleeping with a virgin; a young child; or an old woman; can cure HIV; and
- Traditional healers sometimes use one razor blade on multiple people during ritual cutting without understanding the possible risks of infection.

### 3.2.2 Sexual risky behaviours

The following was discussed around **risky sexual behaviour** during the stakeholder and community engagement workshops in the area:

- There are those men and women who have more than one partner, and they are dishonest about it;
- Some women engage in sex work. Men do as well, however they tend to hide that they are in a relationship purely for financial gain;
- People do not disclose that they are on ART;
- Lack of money, and work, as well as a love of material goods can make people engage in risky sexual behaviours; and
- There are blessers, sugar mamas, ben10s. Older women sleep with younger men by enticing them with money. Older men tend to chase after women much younger than them.

### 3.2.3 Substance abuse

The following was discussed about **substance abuse** during the stakeholder and community engagement workshops in the area:

- People who abuse drugs are at risk of infection;
- In this area there is drug abuse, but people do not use needles; and
- Alcohol abuse results in taking poor decisions, and it is rife in this area. The Lindela area nearby, has many taverns which makes it easy for people to engage in risky behaviours while they are under the influence.

### 3.2.4 Condoms

In Figure 19 and Figure 20 the condom distribution for females and males (annualised) are reflected at Local Municipality level in uMkhanyakude district. The definitions for these indicators can be found in Appendix B: Terms, Definitions and calculations. Due to the small numbers at a local level, it is not included at ward level in this report. See note on small number in Appendix A: Selecting Data for the Profile.

| 2   | kz Jozini Local Municipality              | 3.20                  | No | ( 2034379 | / | 635940 ) | 23.39 % | 29.28 % |
| 3   | kz Hlabisa Local Municipality             | 3.64                  | No | ( 875300  | / | 240588 ) | 10.06 % | 11.08 % |
| 4   | kz Umhlabuyalingana Local Municipality    | 6.85                  | No | ( 3644493 | / | 532056 ) | 41.90 % | 24.49 % |
| 5   | kz The Big 5 False Bay Local Municipality | 7.45                  | No | ( 997931  | / | 133884 ) | 11.47 % | 6.16 %  |

Condoms are readily available in health facilities and NGOs.

### 3.2.5 Key and vulnerable populations

Figure 21 is a reflection of under 18-year-old girls that deliver in facilities. This is a proxy for teenage pregnancies in the community. The indicator definition is included in Appendix B. Due to the small numbers at a local level, it is not included at ward level in this report. See note on small number in Appendix A: Selecting Data for the Profile.

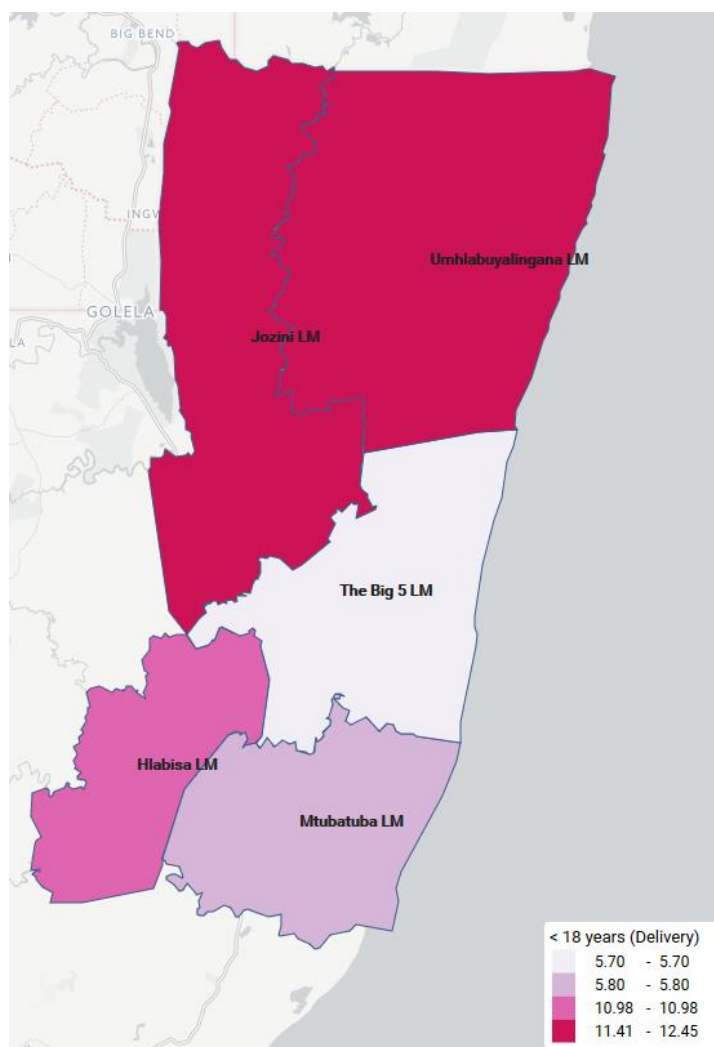

Figure 21: Teenage Pregnancy rate uMkhanyakude district (Source: KZN DHIS 2015)

| KZ UMKHANYAKUDE DISTRICT MUNICIPALITY: 11.1 % |   |                              |   |       |          |         |         |
|---|---|------------------------------|---|-------|----------|---------|---------|
|   | Local Municipality                        | 2015 : < 18 years (Delivery) |   |       |          | NUM %   | DEN %   |
| 1   | kz The Big 5 False Bay Local Municipality | 5.70                         | % | ( 9   | / 158 )  | 0.55 %  | 1.07 %  |
| 2   | kz Mtubatuba Local Municipality           | 5.80                         | % | ( 65  | / 1121 ) | 3.97 %  | 7.62 %  |
| 3   | kz Hlabisa Local Municipality             | 10.98                        | % | ( 452 | / 4116 ) | 27.63 % | 27.97 % |
| 4   | kz Umhlabuyalingana Local Municipality    | 11.41                        | % | ( 552 | / 4837 ) | 33.74 % | 32.87 % |
| 5   | kz Jozini Local Municipality              | 12.45                        | % | ( 558 | / 4483 ) | 34.11 % | 30.47 % |

Table 19 reflects different discussions during the community engagement that relates to key and vulnerable populations specifically.

**Table 19: Key and vulnerable population groups**

| <b>Key and vulnerable population group</b> | <b>Stakeholder and community feedback</b>  |
|--|--|
| Young women                                | There are many young women in the community and they are seen to be in danger of becoming infected, due to poverty and lack of education   |
| Youth                                      | <p>There is a significant number of youth in the area, and they are in danger because they are unemployed, and also uneducated. This leaves them susceptible to relationships where they exchange sex for financial or material gain.</p> <p>They are at risk of indulging in drugs and alcohol, which can also lead to risky sexual behaviour</p>   |
| Sex workers                                | Sex workers are known to operate in the area (which lies along a major highway). They are mostly known to service the truck drivers who work along that highway  |
| Orphans and vulnerable children            | <p>Some children are abandoned by their parents, while others are kicked out of home due to rebellious behaviour.</p> <p>In both cases, such children can fall victim to sexual abuse or exploitation.</p>   |
| Drug users                                 | The use of drugs seems to be one of the propellers of HIV transmission, due to the poor decision making induced by them.   |
| Disabled                                   | Disable people are sexually abused because of their disability and they are afraid to report   |
| Migrant workers                            | <p>Fear of getting to the local clinics by the people from other countries for HIV testing spreads HIV because they end up having sex with local people. Sexual relationships easily take place amongst the population in these settlements.</p> <p>People of other countries are suspected to have illnesses and selling drugs.</p> <p>They are seen to be taking away jobs from the local community.</p> |

### 3.3 Social and structural factors that influence HIV risk

#### 3.3.1 Orphan hood

In 2011, the proportion of orphans was especially high in the rural Wards. High level of HIV prevalence in KwaZulu-Natal has been associated with high proportion of orphans<sup>14</sup> , albeit at provincial level. The detail for Ward 20 that forms the catchment area for Mkuze Clinic is highlighted in the table below.

**Table 20: Orphan hood for Census 2011 at Ward level in Jozini Local Municipality**

| Ward    | Maternal orphans |        |       | Paternal orphans |        |       | Double orphans |        |       |
|---------|------------------|--------|-------|------------------|--------|-------|----------------|--------|-------|
|         | Male             | Female | Total | Male             | Female | Total | Male           | Female | Total |
| Ward 1  | 49               | 48     | 96    | 156              | 175    | 330   | 67             | 74     | 140   |
| Ward 2  | 62               | 76     | 138   | 264              | 264    | 527   | 105            | 109    | 214   |
| Ward 3  | 75               | 79     | 154   | 374              | 403    | 777   | 158            | 147    | 305   |
| Ward 4  | 72               | 94     | 166   | 370              | 347    | 717   | 114            | 122    | 236   |
| Ward 5  | 146              | 149    | 295   | 485              | 437    | 922   | 162            | 138    | 300   |
| Ward 6  | 50               | 64     | 113   | 300              | 278    | 578   | 127            | 93     | 220   |
| Ward 7  | 64               | 44     | 107   | 304              | 247    | 550   | 96             | 119    | 216   |
| Ward 8  | 78               | 75     | 152   | 381              | 328    | 709   | 207            | 175    | 382   |
| Ward 9  | 69               | 74     | 144   | 328              | 312    | 640   | 122            | 102    | 224   |
| Ward 10 | 102              | 88     | 191   | 347              | 362    | 708   | 152            | 154    | 306   |
| Ward 11 | 110              | 89     | 198   | 290              | 281    | 572   | 120            | 124    | 244   |
| Ward 12 | 82               | 89     | 170   | 370              | 299    | 669   | 126            | 109    | 234   |
| Ward 13 | 99               | 101    | 200   | 364              | 364    | 728   | 91             | 75     | 166   |
| Ward 14 | 91               | 104    | 195   | 344              | 380    | 724   | 179            | 144    | 324   |
| Ward 15 | 83               | 94     | 177   | 317              | 295    | 613   | 113            | 142    | 255   |
| Ward 16 | 85               | 64     | 149   | 360              | 360    | 720   | 110            | 113    | 224   |
| Ward 17 | 102              | 75     | 177   | 396              | 404    | 800   | 146            | 163    | 309   |

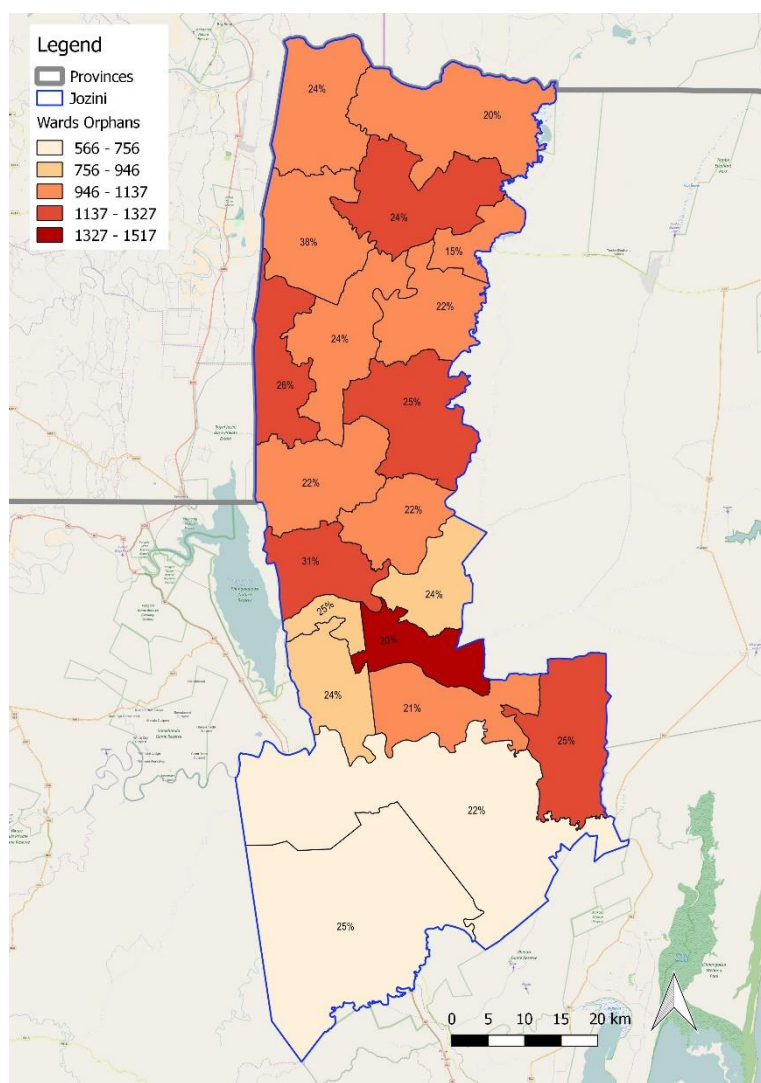

Figure 22: Total number of Orphans with percentage that are double orphans per ward (Source Census 2011)

The following were identified as associated risks for **Orphans and vulnerable children**:

- Some children are abandoned by their parents, while others are kicked out of home due to rebellious behaviour; and
- In both cases, such children can fall victim to sexual abuse or exploitation.

### 3.3.2 Cultural and Religious Norms

Stakeholder and community engagement workshops revealed the following about **cultural and religious norms**:

- Some religious leaders encourage their congregants to stop taking treatment and receive healing in the church;
- Sometimes traditional healers use the same razor on multiple people during ritual cutting; and
- If a man is in a polygamous marriage, he most likely won't use a condom with any of his wives and that can contribute to the spread of HIV.

### 3.3.3 Gender norms and gender-based violence

Stakeholder and community engagement workshops revealed that a man can beat a woman just because he does not want to engage in safe sex.

### 3.3.4 Stigma

Stakeholder and community engagement workshops revealed that people fear reporting on their status to others due to feeling ashamed, and fearing being looked down upon by the people around them.

### 3.3.5 Poverty

Poverty is measured through the South Africa Multidimensional Poverty Index (SAMPI)<sup>15</sup>. The detail for Ward 20 that forms the catchment area for Mkuze Clinic is highlighted in the table below.

**Table 21: Poverty measures for Census 2011 at Ward level in Jozini Local Municipality**

|         | Poverty Headcount (H) | Intensity of Poverty (A) | SAMPI (HxA) |
|---------|-----------------------|--------------------------|-------------|
| Ward 1  | 25.7                  | 42.8                     | 0.110       |
| Ward 2  | 18.3                  | 42.9                     | 0.079       |
| Ward 3  | 25.5                  | 41.3                     | 0.105       |
| Ward 4  | 30                    | 41.8                     | 0.125       |
| Ward 5  | 20.1                  | 43.3                     | 0.087       |
| Ward 6  | 23.8                  | 42.7                     | 0.102       |
| Ward 7  | 7.1                   | 41.6                     | 0.030       |
| Ward 8  | 21.5                  | 41.6                     | 0.089       |
| Ward 9  | 26.9                  | 42.5                     | 0.114       |
| Ward 10 | 32.2                  | 43.2                     | 0.139       |
| Ward 11 | 21.6                  | 41.3                     | 0.089       |
| Ward 12 | 29.9                  | 44.3                     | 0.132       |
| Ward 13 | 29.4                  | 45.7                     | 0.134       |
| Ward 14 | 20.5                  | 41.6                     | 0.085       |
| Ward 15 | 30.3                  | 42.7                     | 0.129       |
| Ward 16 | 19.4                  | 40.4                     | 0.078       |
| Ward 17 | 28.5                  | 42.2                     | 0.120       |
| Ward 18 | 27.5                  | 42.9                     | 0.118       |
| Ward 19 | 26.1                  | 42.1                     | 0.110       |
| Ward 20 | 7.6                   | 41.8                     | 0.032       |

Ward 10 was the poorest Ward in Jozini Local Municipality with 32.2% being poor households (Table, Appendix B). Ward 7 had the lowest head count at 7.1%. The greatest contributors to high poverty measures in KZN are health (measured by child mortality) and education (measured by years of schooling and school attendance). The Multidimensional Poverty Index for Jozini Local Municipality

<sup>15</sup> SAMPI is the product of the headcount (proportion of households defined as multi-dimensionally poor using the poverty cut-off) and intensity of poverty (average proportion of indicators in which poor households are deprived). The SAMPI constitutes weighted education, health, assets, and economic activity (unemployment rates) indicators.

changed between 2001 (Figure 23) and 2011 (Figure 24). In 2001 the highest Poverty Index was 28.13. This reduced to 13.91 in 2011.

Stakeholder and community engagement workshops revealed the following about **poverty** and how this affects HIV in the area:

- Sex work is something that occurs in the area due to lack of employment opportunities;
- Too many people living in close proximity allow diseases to flourish; and
- Sometimes the breadwinner in the family dies, and the children left behind are forced to exchange sex for necessities.

### 3.3.6 Employment

In Jozini Local Municipality, 14% of the female population at economically active age are employed while 16% of the economically active males are employed. See Figure 27 below.

Figure 27: Female and Male employment Jozini Local Municipality (Source Census 2011)

Unemployment of youth in Jozini Local Municipality is at 88.4%.

Figure 28: Youth unemployment Jozini Local Municipality (source Census 2011)

In comparison with the Jozini Local Municipality a bigger percentage of females and males are employed from the total population in the Mkuze clinic catchment area. In this area 33% of the female population and 44% of the male population is employed (see Figure 29).

Figure 29: Female and Male employment Mkuze clinic catchment area (Source Census 2011)

Fewer youth (66.1%) are unemployed in the Mkuze clinic catchment area than the Jozini Local Municipality (88.4%).

Figure 30: Youth unemployment Mkuze clinic catchment area (source Census 2011)

During the stakeholder and community engagement workshops the following was said about **employment** and how this affects HIV in the area:

- There are limited job opportunities in the area. The sentiment is that foreign nationals are the ones who are hired, while local people are left without jobs; and
- There are instances of nepotism reported, or one has to exchange money or sex to find employment.

### 3.3.7 Types of settlements

Stakeholder and community engagement workshops felt that the ***types of settlements*** have the following influences in the area:

- The types of dwellings in the area are of a poor standard;
- The area is underdeveloped and there is overcrowding;
- In RDP houses, there is overcrowding, with between 20 and 30 people living in the same house;
- In squatter camps and rented back rooms, there is also overcrowding;
- Children share spaces with adults and end up learning adult habits such as, sex and alcohol use. This can end up in children being raped and engaging in continuous sexual activity; and
- There are too many taverns where people over indulge in alcohol and end up having unsafe sex.

### 3.3.8 Migration patterns in the area

People from outside countries bring diseases with them, such as HIV with different strains from other regions in Africa.

### 3.3.9 Education and literacy

School children sometimes sleep with their teachers, due to lack of food and necessities at home, as a result of parents being unemployed.

### 3.3.10 Hate crimes – xenophobic, homophobic, other

Foreign nationals are seen to be the ones who bring drugs to sell. They then engage in sexual activity with local people and spread the virus in that way.

### 3.3.11 Disability

Participants in stakeholder and community engagement workshops felt that the ***people with disabilities*** are sexually abused, and end up being infected with different STIs, as well as HIV. They also have a fear of reporting, which keeps their health status hidden.

## 4. Services in the Local Municipality

### 4.1 Health facilities

There are 16 health facilities in Jozini Local Municipality. See Figure 31 below for distribution of these facilities.

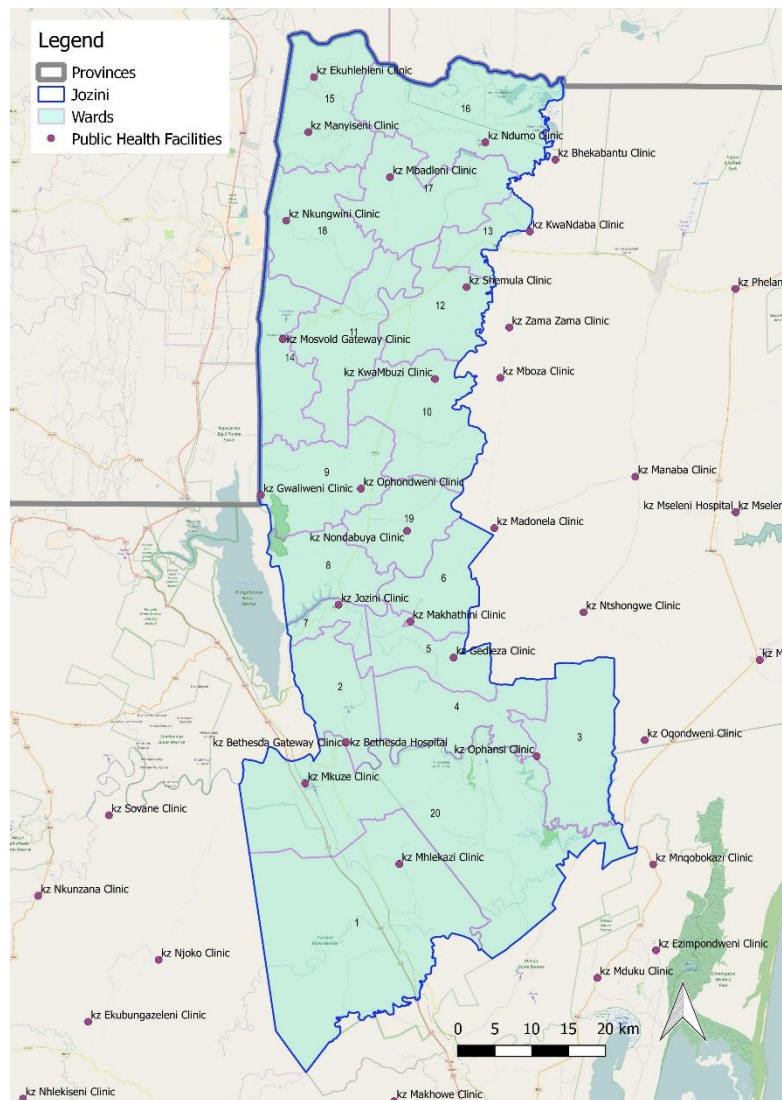

Figure 31: Distribution of health facilities in Jozini Local Municipality

## **5. Recommendations for multi-sectoral interventions and focus on key and vulnerable populations**

Based on the priorities identified in the profile for high burden areas, a mechanism needs to be put in place to coordinate the multi-sectoral response at the various levels. This is to ensure a comprehensive approach and to build sustainability of the response with local ownership. Coordination of the multi-sectoral interventions at the level of implementation would result in:

- increased access to available resources;
- more efficient use of resources;
- enhancement of accountability;
- development of innovative implementation strategies and modalities;
- broadened awareness about the priorities highlighted in the risk profile;
- development of new partnerships to render services;
- sustainable development of activities;
- broadened sharing of responsibility for different, yet related activities;
- stronger ownership by stakeholders;
- use of strengths of different partners; and
- sharing of new knowledge and lessons learnt.

**Process for development and implementation of multi-sectoral HIV, TB and STI intervention packages through existing multi-sectoral coordination structures e.g. AIDS Councils, OSS war rooms:**

1. Update community profiles with directory of existing services e.g. rendered by government, NGO, donor funded organisations. This will be used to determine resources and programmes already available to address the priorities in the community profile as well as resource and programme gaps that exist;
2. Communicate and validate the profiles through meetings with government, private and civil society organisations in the specific geographical area;
3. Present the profile findings and recommendations for multi-sectoral interventions to the multi-sectoral structure for validation of findings, prioritization of programmatic gaps and linkage with existing resources (final decision on resource allocation should be requested through appropriate channels, e.g. government processes, Global Fund etc.);
4. For gaps prioritised, identify possible service providers and interventions that can address the needs following the relevant government or donor processes and procedures (depending on source of funding); and
5. Provincial, district and local coordination structures to coordinate an implementation plan with clear activities, timelines and responsible stakeholders that aligns with the profile. This will form the foundation for tracking performance and progress against the implementation plan; and
6. Further and focused engagement to be done with the Young women and girls group identified as the priority population in this area to have a detailed understanding of their specific risks.

Table 26 summarises the key and vulnerable populations as well as priority interventions identified during the development of the community profiles in each of the seven local municipalities in the District. Due to the importance of TB as the main cause of death in the district, it is included in the priority interventions.

**Table 26: Key and vulnerable populations as well as priority interventions identified in high burden areas**

| <b>Key and vulnerable populations TB</b>   | <b>Priority interventions</b>  |
|--|--|
| <ul style="list-style-type: none"> <li>• People living with HIV</li> <li>• Household contacts of TB index patients</li> <li>• Health care workers</li> <li>• Pregnant women</li> <li>• Children &lt; 5 years old</li> <li>• People living in informal settlements</li> </ul> | <ul style="list-style-type: none"> <li>• TB contact tracing, testing and post-exposure management</li> <li>• Enhanced health education about HIV/TB co-infection, reinfection</li> <li>• Service delivery and treatment delivery points in community, non-traditional settings</li> </ul>  |
| <b>Key and vulnerable populations HIV</b>  | <b>Priority interventions</b>  |
| <ul style="list-style-type: none"> <li>• Sex workers</li> <li>• Drug users</li> <li>• Young women and girls</li> </ul>   | <ul style="list-style-type: none"> <li>• Poverty, especially livelihoods support, to mitigate transactional sex as a source of income</li> <li>• Comprehensive, targeted, location-specific HIV prevention programmes designed for sex workers and truck drivers</li> <li>• Substance abuse, particularly among youth and by-law enforcement at liquor outlets (licensing conditions)</li> <li>• Employment programmes targeted at vulnerable populations</li> <li>• Overcrowding in RDP settlements that contribute to sexual risk behaviour</li> </ul> |

Considering the priorities identified during the stakeholder and community workshops as well as the general profile, the following service delivery packages are recommended in line with the National Strategic Plan for HIV, TB and STIs (2017 to 2022) and other relevant strategic documents. These service delivery packages need to be unpacked and included in the implementation plan referred to above based on the existing resource envelop in the area. Priority is given to the key and vulnerable populations identified, followed by other interventions identified in the NSP.

## Appendix A: Selecting Data for the Profile

It is important to note that the quality of an HIV epidemic and risk profile depends on the quality of secondary data used. The following are considerations for reviewing data and data sources to be used in the epidemiologic profile:

- **Completeness of the data:** How well do the prevalence of HIV and the associated factors represent the true number of persons living with HIV in the selected service and/or administrative area?
- **Representativeness of the data:** How well do the characteristics from a data source correspond to the characteristics of the overall population? For example, data from a hospital-based sample may not represent all HIV-infected persons or all HIV-infected persons in care in the area covered by the survey.
- **Age of the data:** For example, a behavioural survey conducted in 2000 might not provide data that are sufficiently up-to-date for current prevention activities.
- **Timeliness of the data:** if dealing with administrative data, how long is the reporting delay between the diagnosis of HIV and associated socio demographic characteristics recorded and reported to relevant departments?
- **Surrogate, or proxy, markers:** A proxy variable can be used as a marker for other variables when what we really want to measure is too difficult to measure directly. For example, some areas may use STI data as a proxy when data on sexual behaviours are not available.
- **Reliability of the data:** How accurate and complete are the data? For example, how well was information e.g. age, recorded whether in a survey or in administrative records and transcribed to the case report from the medical record.
- **Small numbers:** Small numbers of cases need to be interpreted with caution because small absolute changes in the number of cases can produce large relative or proportionate changes in rates that may be misinterpreted by end users. Rates calculated from numerators smaller than 10 should be denoted in a footnote as unreliable.

### Data assumptions and limitations

The National Department of Health collects routine HIV data. The data is captured in the National Health Information Repository and Data warehouse (NIRDS), through the provincial and district health information systems (DHIS). The data are mostly obtained through routine service delivery by providers e.g. health facilities, and PHC clinics and consist of reports of confirmatory HIV tests, viral loads and CD4 counts. Additionally, the system captures case reports and interview data that might include information on socio-demographics e.g. age, race, sex. Data on socio demographics rely heavily on patient and provider reporting. In most cases data of this nature may be obtained from independent cross-sectional and bio-behavioural surveys and only reported at much higher geographical levels than local levels or high burden areas. The bio-behavioural surveys also provide data on sexual risk behaviours.

Age breakdown of routine indicators are limited to predefined indicators, with no sex breakdown available at Provincial and National Dataset level. No key population specific data can be segregated from any of the available datasets. Given the importance of key populations in understanding of the local context, this is considered a serious limitation in available routine data. Data on HIV risk exposure or mode of transmission require disease specialists and willingness of patient to participate is also not available at national and/or local level. Mobile clinic data is reported under the point where mobile is working from and is not segregated by service delivery point. This skews the picture when data is projected geospatially. Sexual risk data not part of routine data collected, secondary data available from surveys are included for this yet this is only available at District level. Figure 32 below reflects on the source of various levels of data for the profile. Data is presented at the level that it is available.

**Figure 32: Data pyramid used for risk profiles**

Care is also taken to avoid reporting on small number of cases without caution. Definitions and outlines of calculations are provided in

### **Catchment area and catchment populations**

The catchment population is different from a catchment area, whereby the population is not simply just a count of the total number of people that are resident within that geographical boundary, but is rather an estimate of the estimated population that could access that specific facility.

Agreement on a health-care facility's catchment area is an important component in the Focus for Impact approach for defining the soft boundary for associated risk profiling within the catchment population linked to a specific HIV high burden area, estimate population-based rates of HIV, TB and STI as well as other important analyses.

Working closely with the KZN DoH, the DoH used a geospatial approach to allocate each ward in KZN to the closest health facility. For the purposes of the Focus for Impact approach only the catchment area of fixed PHC facilities were used. Please keep in mind that multiple PHC facilities (fixed and mobile) refer to a specific Hospital and therefore relates to a larger catchment area that might overlap with several PHC facility catchment areas.

## HIV associated risks

The diagram illustrates the complex interplay of factors that facilitate and inhibit HIV spread, leading to different outcomes. It is structured as follows:

- Factors facilitating HIV spread (Top Left):**
  - Community level:** HIV Prevalence, Poverty, Urbanisation, Cultural/structural context, Stigma.
  - Individual level:** Multiple concurrent partners, Mixing age partners.
- Factors inhibiting HIV spread (Bottom Left):**
  - Community level:** Interventions Programmes, Religious and cultural norms, Literacy.
  - Individual level:** Delayed Sexual Debut, Sequential partners, HIV knowledge.
- Transmission Dynamics (Center):**
  - Number of exposures of susceptible to infected person per unit time:** Influenced by facilitating factors (downward arrow) and inhibiting factors (upward arrow).
  - Efficiency of transmission per contact:** Influenced by facilitating factors (downward arrow) and inhibiting factors (upward arrow).
  - Duration of infection period:** Influenced by facilitating factors (downward arrow) and inhibiting factors (upward arrow).
  - Multiplication (X):** The three central boxes are multiplied together to determine the final outcomes.
- Outcomes (Right):**
  - Mortality:** Resulting from the transmission dynamics.
  - HIV incidence and prevalence:** Resulting from the transmission dynamics.

Page 59

## Appendix B: Terms, Definitions and calculations

|   |   |
|---|---|
| ANC client HIV 1st test positive rate (routine health indicator DHIS 2015)      | <p>Short Name - ANC HIV 1st test pos rate</p> <p>Numerator - Antenatal client HIV 1st test positive</p> <p>Denominator - Antenatal client HIV 1st test</p> <p>Indicator Type - %</p> <p>Definition - Antenatal clients tested HIV positive as proportion of antenatal clients HIV tested for the first time during current pregnancy</p>  |
| Antenatal client HIV re-test positive rate (routine health indicator DHIS 2015) | <p>Short Name - ANC HIV re-test pos rate</p> <p>Numerator - Antenatal client HIV re-test positive</p> <p>Denominator - Antenatal client HIV re-test</p> <p>Indicator Type - %</p> <p>Definition - Antenatal clients re-tested positive for HIV as proportion of antenatal clients re-tested for HIV</p>   |
| Behavioral data   | Data collected from studies of human behavior that is relevant to disease risk. Relevant behaviors for HIV risk may include sexual activity, substance use, needle sharing, condom use, or responses to primary and secondary prevention messages, knowledge of HIV transmission and prevention   |
| Data  | Raw, unprocessed numbers  |
| Delivery in facility under 18 years rate (routine health indicator DHIS 2015)   | <p>Short Name - Delivery 18 rate</p> <p>Numerator - Delivery under 18 years in facility</p> <p>Denominator - Delivery in facility - total</p> <p>Indicator Type - %</p> <p>Definition - Deliveries to women under the age of 18 years as proportion of total deliveries in health facilities</p>  |
| Dependency ratio  | The dependency ratio is an indicator of potential dependency burden of children and the elderly on those who are of economically productive ages in a population. Source Census 2011  |
| Epidemiologic profile   | A document that describes the distribution of HIV in various populations and identifies characteristics both of HIV-infected and HIV-negative persons in defined geographic areas. It is composed of information gathered to describe the effect of HIV on an area in terms of socio-demographic, geographic, behavioral, and clinical characteristics. Identifies characteristics of the general population and of populations who are living with, or at high risk for HIV infection in the pre-defined geographic areas in need of primary and secondary prevention or care services; and also identifies social, behavioral, cultural, factors driving local HIV infection. This providing information required to conduct needs assessments and gap analyses to complete the local HIV profile |
| Female condom distribution coverage (routine health indicator DHIS 2015)        | <p>Short Name - Fem condom dist cov</p> <p>Numerator - Female condoms distributed</p> <p>Denominator - Female population 15 years and older</p> <p>Indicator Type - %</p>   |

|  |   |
|--|---|
|  | Definition - Female condoms distributed from a primary distribution site to health facilities or points in the community (e.g. campaigns, non-traditional outlets, etc.)  |
| HIV prevalence amongst client tested 15-49 years rate (routine health indicator DHIS 2015) | <p>Short name - HIV test 15-49y pos rate</p> <p>Numerator - HIV test positive 15-49 years, excl ANC</p> <p>Denominator - HIV test 15-49 years, excl ANC</p> <p>Indicator Type - %</p> <p>Description - Proportion of clients on whom an HIV test was done who tested positive for the first time</p>  |
| HIV test positive child 12-59 months rate (routine health indicator DHIS 2015)             | <p>Short Name - HIV+ 12-59 rate</p> <p>Numerator - HIV test positive 12-59 months</p> <p>Denominator - HIV test 12-59 months</p> <p>Indicator Type - %</p> <p>Definition - Children 12 to 59 months who tested HIV positive as a proportion of children who were tested for HIV in this age group</p>   |
| HIV test positive child 5-14 years rate (routine health indicator DHIS 2015)               | <p>Short Name - HIV+ 5-14 rate</p> <p>Numerator - HIV test positive 5-14 years</p> <p>Denominator - HIV test child 5-14 years</p> <p>Indicator Type - %</p> <p>Definition - Children 5 to 14 years who tested HIV positive as a proportion of children who were tested for HIV in this age group</p>  |
| Incidence  | The number of new infections in a defined population during a specific period, often 1 year, which can be used to measure disease frequency. There is an important difference between HIV incidence and a new diagnosis of HIV infection: HIV incidence refers to persons newly infected with HIV, whereas persons newly diagnosed with HIV may have been infected years before the diagnosis. Population-based incidence estimates include new infections that have been diagnosed as well as new infections that have not been diagnosed. HIV incidence data may be used to monitor emerging trends and guide prevention activities |
| Indicators   | A quantitative or qualitative variable that provides a simple and reliable measurement of one aspect of performance, achievement or change in a program or project  |
| Infant 1st PCR test positive around 6 weeks' rate (routine health indicator DHIS 2015)     | <p>Short Name - PCR at 10w pos rate</p> <p>Numerator - Infant PCR test positive around 6 weeks</p> <p>Denominator - Infant PCR test around 6 weeks</p> <p>Indicator Type - %</p> <p>Definition - Infants tested PCR positive for follow up test as a proportion of Infants PCR tested around 6 weeks</p>  |
| Infant rapid HIV test around 18 months positive rate (routine health indicator DHIS 2015)  | <p>Short name - HIV test 18m pos rate</p> <p>Numerator - HIV test positive around 18 months</p> <p>Denominator - HIV test around 18 months</p> <p>Indicator Type - %</p> <p>Description - Infants tested positive for HIV antibodies around 18 months</p>   |

|  |   |
|--|---|
|  | after birth as the proportion of Infants tested for HIV antibodies around 18 months   |
| Information  | Processed or analyzed data that adds context through relationships between data to allow for interpretation and use   |
| Intensity of poverty   | The average proportion of indicators in which poor households are deprived. Example, an intensity of 44% in 2011 means the average intensity of poverty was 44% amongst the 20% poor households   |
| Male condom distribution coverage (routine health indicator DHIS 2015) | <p>Short Name - Male cond dist cov</p> <p>Numerator - Male condoms distributed</p> <p>Denominator - Male population 15 years and older</p> <p>Indicator Type - %</p> <p>Definition - Male condoms distributed from a primary distribution site to health facilities or points in the community (e.g. campaigns, non-traditional outlets, etc.)</p>  |
| Male urethritis syndrome rate (routine health indicator DHIS 2015)     | <p>Short Name - MUS rate</p> <p>Numerator - Male Urethritis Syndrome treated - new episode</p> <p>Denominator - STI male - new episode</p> <p>Indicator Type - %</p> <p>Definition - Male Urethritis Syndrome new episodes treated as a proportion of total males with STI new episodes treated</p>   |
| Modes of HIV transmission or mode of HIV exposure                      | Heterosex (or heterosexual contact with a partner who is HIV positive or at increased risk for HIV. Often this level of knowledge about sexual partners (anonymous, casual, or exclusive) may be unknown; Men who have sex with men (MSM); People who Inject Drugs (PWID); Joint risk of MSM/PWID; and Other mode of exposure including (transplant, hemophilia, transfusion or mother with HIV or HIV risk (PMTCT) |
| Morbidity  | The presence of illness in the population.  |
| Mortality  | The total number of persons who have died of the disease of interest. Usually expressed as a rate, mortality (total number of deaths over the total population) measures the effect of the disease on the population as a whole   |
| Percentage   | A proportion of the whole, in which the whole is 100. Example: Assume that 10 of the 40 cases of AIDS in a given year in a Ward occurred in men. $(10 \div 40) \times 100 = 25\%$   |
| Poverty Headcount  | The proportion of households defined as multi-dimensionally poor using the poverty cut-off. Example a headcount of 20% in 2011, based on 2011 census, means that 20% of households in South Africa were poor.   |
| Prevalence   | The proportion of cases of a disease in a population at risk, measured at a given point in time (often referred to as point prevalence). Prevalence can also be measured over a period of time (e.g., a year; known as period prevalence). Prevalence does not indicate how long a person has had a disease. It can provide an estimate of risk for a disease at a specific time.                                   |

|  |  |
|--|--|
|  | Prevalence data provide an indication of the extent of a condition and may have implications for services needed in a community. For HIV surveillance, prevalence refers to living persons with HIV disease, regardless of time of infection or date of diagnosis.   |
| Qualitative data                         | Information from sources such as narrative behaviour studies, focus group interviews, open-ended interviews, direct observations, ethnographic studies, and documents. Findings from these sources are usually described in terms of common themes and patterns of response rather than by numeric or statistical analysis. Qualitative data often complement and help explain quantitative data   |
| Quantitative data                        | Numeric information (e.g., numbers, rates, and percentages).   |
| Rate                                     | <p>Measure of the frequency of an event compared with the number of persons at risk for the event. When rates are being calculated, it is usual for the denominator to be the general population rather than the population potentially exposed to HIV infection by various high-risk behaviours. The size of the general population is known from data from the U.S Census Bureau, whereas the size of a population at high risk is usually not known.</p> $\frac{\text{number of HIV diagnoses}}{\text{Population}} \times 100000 = \text{population rate of HIV diagnosis}$ <p>Calculated for a given period. The multiplier (100,000) is used to convert the resulting fraction to number of cases per 100,000 populations. Although arbitrary, the choice of 100,000 is standard practice.</p> <p>Example: Assume that 200 cases of HIV disease were diagnosed during 2014 in a Ward X and that 400,000 persons lived in the Ward X in 2014</p> <p>Rate: <math>200 \div 400,000 \times 100,000 = 50</math> per 100,000</p>  |
| Routine health service based information | <p>In terms of the National Health Act (Act 61 of 2003) the National Department of Health (NDoH) is required to facilitate and coordinate the establishment, implementation and maintenance of health information systems at all levels. The District Health Management Information System (DHMIS) Policy 2011 defines the requirements and expectations to provide comprehensive, timely, reliable and good quality routine evidence for tracking and improving health service delivery. The strategic objectives of the policy are to strengthen monitoring and evaluation (M&amp;E) through standardization of data management activities and to clarify the main roles and responsibilities at each level for each category of staff to optimize completeness, quality, use, ownership, security and integrity of data.</p> <p>In 2000 the District Health Information System (DHIS) was adopted as the official South African routine health information system for managing aggregated routine health service based information. This information is defined as specific indicators and used in Focus for Impact to ensure</p> |

|  | standardization of indicators across the different geographical areas.<br><br>Source: Department of Health. 2015. NDOH Data Directory. Available online from <a href="http://dd.dhmis.org/index.html">http://dd.dhmis.org/index.html</a>   |  |           |                     |        |                 |  |           |                    |  |                   |  |                    |                   |  |
|--|--|--|-----------|---------------------|--------|-----------------|--|-----------|--------------------|--|-------------------|--|--------------------|-------------------|--|
| Service area   | The jurisdictions of service areas or planning regions of respective planning groups. Example Health districts, sub- districts, wards or health facility catchment areas   |  |           |                     |        |                 |  |           |                    |  |                   |  |                    |                   |  |
| Socio-demographic factors  | Background information about the population of interest (e.g., age, sex, race, educational status, income, geographic location). These factors are often thought of as explanatory because they help us to make sense of the results of our analyses   |  |           |                     |        |                 |  |           |                    |  |                   |  |                    |                   |  |
| Socio-economic status (SES)  | A measure of social and economic factors that helps to describe a person's standing in society (e.g., income level, relationship to the national poverty line, educational achievement)  |  |           |                     |        |                 |  |           |                    |  |                   |  |                    |                   |  |
| South Africa Multidimensional Poverty Index (SAMPI <sup>16</sup> ) (StatSSA, 2014) | <p>The SAMPI is based on the global Multidimensional Poverty Index (MPI) which is an international measure of acute poverty. The MPI “complements traditional income/ expenditure-based poverty measures by capturing the severe deprivations that each person or household faces with respect the following dimensions: - education (measured by years of schooling and school attendance indicators), health (measured by nutrition and child mortality indicators), and living standards (measured by indicators such as cooking fuel, Sanitation, water, electricity, floor, and assets).</p> <p>The MPI creates a comprehensive picture of who and where people are that are living in poverty... [and it also] permits comparisons within countries by population group, settlement type, as well as other key household and community characteristics.</p> <p>The SAMPI includes an additional dimension –the economic activity indicated by adult unemployment</p> <table><tr><th>Dimension</th><th>Indicator</th><th>Deprivation cut-off</th></tr><tr><td>Health</td><td>Child mortality</td><td>If any child under the age of 5 h died in the past 12 months</td></tr><tr><td rowspan="2">Education</td><td>Years of schooling</td><td>If no household member aged 15 or older has completed 5 years of schooling</td></tr><tr><td>School attendance</td><td>If any school-aged child (aged 7 to 15) is out of school</td></tr><tr><td>Standard of living</td><td>Fuel for lighting</td><td>If household is using paraffin/candles/nothing/other</td></tr></table> | Dimension  | Indicator | Deprivation cut-off | Health | Child mortality | If any child under the age of 5 h died in the past 12 months | Education | Years of schooling | If no household member aged 15 or older has completed 5 years of schooling | School attendance | If any school-aged child (aged 7 to 15) is out of school | Standard of living | Fuel for lighting | If household is using paraffin/candles/nothing/other |
| Dimension  | Indicator  | Deprivation cut-off  |           |                     |        |                 |  |           |                    |  |                   |  |                    |                   |  |
| Health   | Child mortality  | If any child under the age of 5 h died in the past 12 months               |           |                     |        |                 |  |           |                    |  |                   |  |                    |                   |  |
| Education  | Years of schooling   | If no household member aged 15 or older has completed 5 years of schooling |           |                     |        |                 |  |           |                    |  |                   |  |                    |                   |  |
|  | School attendance  | If any school-aged child (aged 7 to 15) is out of school                   |           |                     |        |                 |  |           |                    |  |                   |  |                    |                   |  |
| Standard of living   | Fuel for lighting  | If household is using paraffin/candles/nothing/other                       |           |                     |        |                 |  |           |                    |  |                   |  |                    |                   |  |

<sup>16</sup> StatSSA. (2014). *The South African MPI: Creating a multidimensional poverty index using census data*. Pretoria, South Africa.

|  |   |                           |  |
|--|---|---------------------------|--|
|  |   | Fuel for heating          | If household is using paraffin/wood/coal/dung/other/none   |
|  |   | Fuel for cooking          | If household is using paraffin/wood/coal/dung/other/none   |
|  |   | Water access              | If no piped water in dwelling or on stand  |
|  |   | Sanitation type           | If not a flush toilet  |
|  |   | Dwelling type             | If an informal shack/traditional dwelling/caravan/tent/other   |
|  |   | Asset ownership           | If household does not own more than one of radio, television, telephone or refrigerator and does not own a car |
|  | Economic activity   | Unemployment (all adults) | If all adults (aged 15 to 64) in the household are unemployed  |
| <p>SAMPI is the product of the headcount (proportion of households defined as multi-dimensionally poor using the poverty cut-off) and intensity of poverty (average proportion of indicators in which poor households are deprived)</p> <p>Example - If the headcount poverty was 20% in 2011 (i.e. 20% of all households were poor in 2011), and the average intensity of poverty amongst the poor households was 44%. Then the SAMPI equals 0.09(=20% X 44%)</p> <p>In an extremely poor society where all households are poor and are deprived in all dimension indicators, the SAMPI score would be 1, 0. However, in an impoverished society where 50% of households are poor and experienced deprivation on 50% of all dimensions, the SAMPI score would be 0. 25.</p> |   |                           |  |
| TB (pulmonary) case finding index (routine health indicator DHIS 2015)   | <p>Short name - PTB case finding index</p> <p>Numerator - TB suspect 5 years and older sputum sent</p> <p>Denominator - PHC headcount 5 years and older</p> <p>Description - Proportion of clients 5 years and older, who were identified as TB suspects and for whom sputum was sent to the laboratory</p> <p>Growth-Sentiment - negative (high values are negative, low values are ideal: positive)</p> |                           |  |
| TB suspect smear positive rate (routine health indicator DHIS 2015)  | <p>Short name - TB suspect smear pos rate</p> <p>Numerator: TB suspect 5 years and older test positive</p> <p>Denominator: TB suspect 5 years and older sputum sent</p> <p>Indicator Type - %</p> <p>Description - Proportion of TB suspects with smear positive sputum results</p> <p>Growth-Sentiment: negative (high values are negative, low values are ideal: positive)</p>                          |                           |  |

|  |   |
|--|---|
| <p>TB suspect sputum test rate (routine health indicator DHIS 2015)</p>          | <p>Short name - TB susp sputum test rate</p> <p>Numerator - TB suspect 5 years and older sputum sent</p> <p>Denominator - TB suspect 5 years and older identified</p> <p>Indicator Type - %</p> <p>Description - Proportion of TB suspects with sputum sent to the laboratory for testing</p> <p>Growth-Sentiment: positive (low values are negative, high values are ideal: positive)</p>        |
| <p>TB suspect treatment initiation rate (routine health indicator DHIS 2015)</p> | <p>Short name - TB suspect treatment rate</p> <p>Numerator - TB suspect 5 years and older initiated on treatment</p> <p>Denominator - TB suspect 5 years and older test positive</p> <p>Indicator Type - %</p> <p>Description - Proportion of smear positive TB suspects initiated on treatment</p> <p>Growth-Sentiment - positive (low values are negative, high values are ideal: positive)</p> |
| <p>Triangulation</p>   | <p>Synthesis of data to compare and contrast the results of different kinds of research that address the same topic</p>   |

## **Appendix C: Methodology for stakeholder engagement to explore local level data**

The feedback from the community brings a local intelligence and ownership to the process that not only facilitates buy-in for HIV programming, but also brings about an opportunity for advocacy and accountability at this level. This gives new meaning to ‘nothing about us, without us’. There is internal validation and triangulation of the data through this process, as stakeholders should be from various sectors/departments and types of organisations. Groups within the workshop validate the information before it is documented. In addition, the same information is tested with a community group (that should include members of key populations) and additions made with consensus.

Figure 34 below describes the various steps followed to develop this risk profile. A detailed guideline is available from SANAC that can be used by stakeholders and partners to ensure a standardised approach in the development and updating of the risk profile.

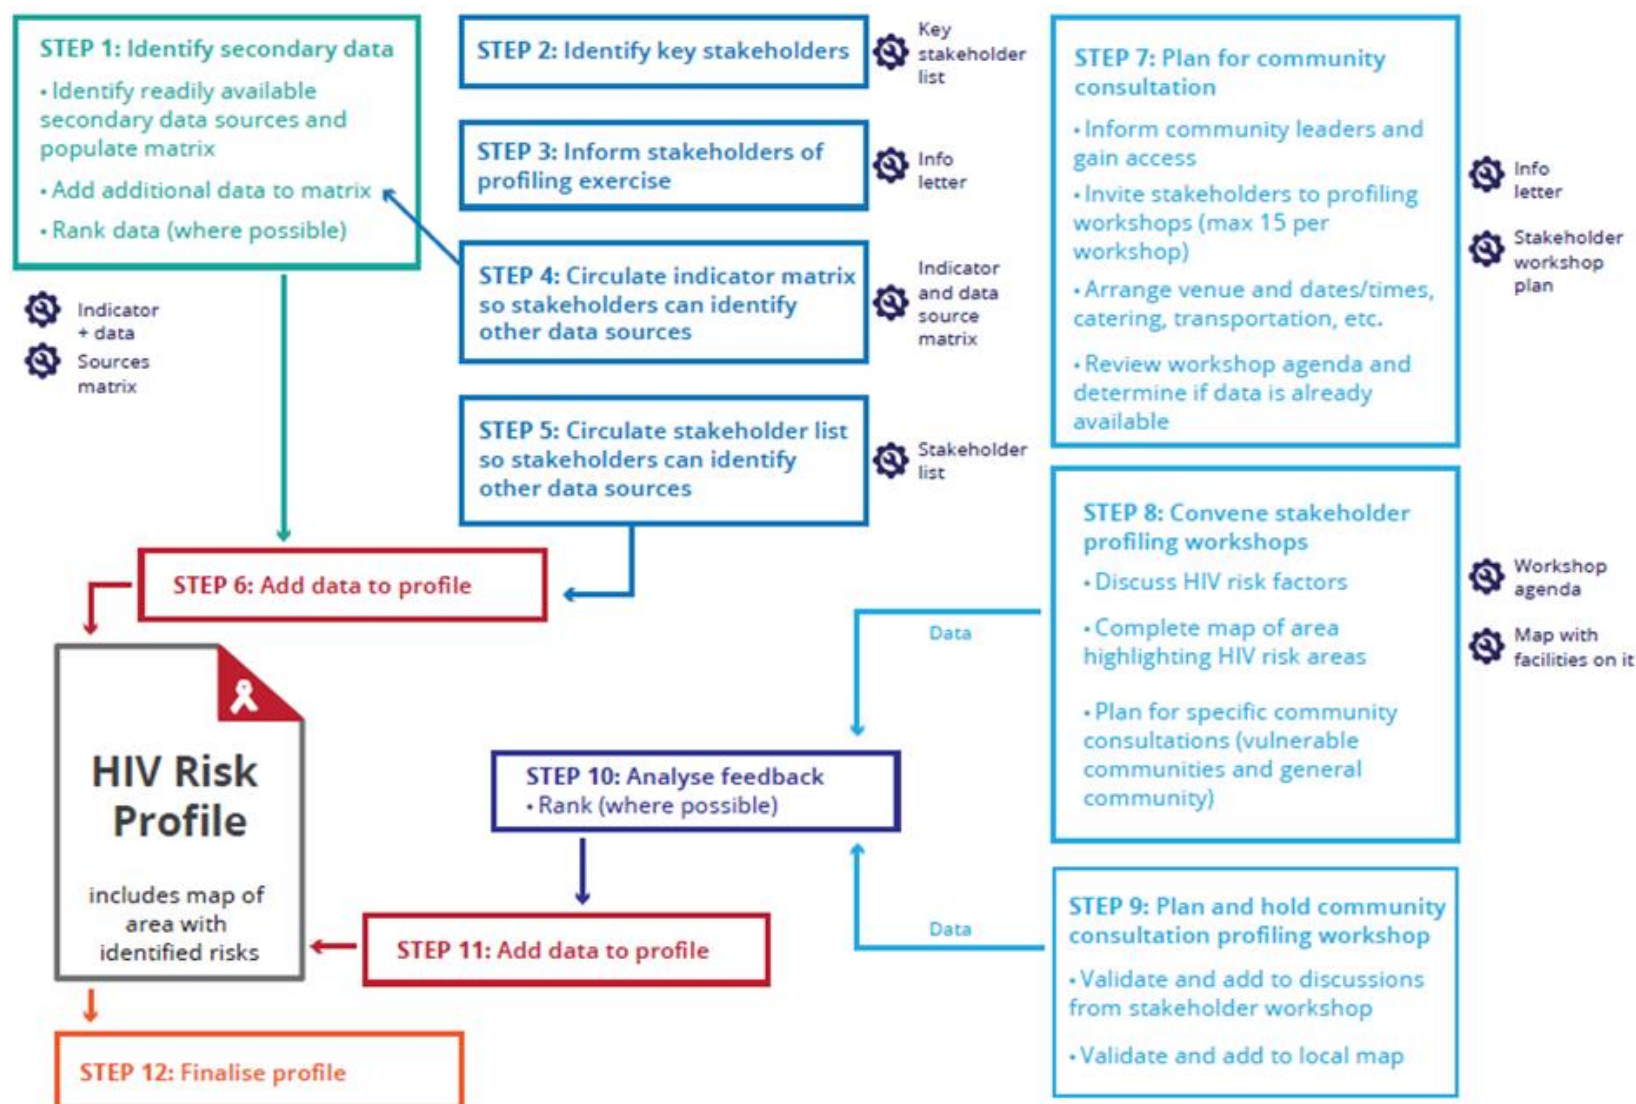

Figure 34: Steps for development of HIV associated risk profile
